Sequence 13766, Application US/10369493
Fiblication No. US20030233675A1
GENERAL INFORMATION:
APPLICANT: Cao, Yongwei
APPLICANT: Slater, Steven C.
APPLICANT: Goldman, Barry S.
FITTE OF INVENTION: EXAMPLESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF TITLE OF INVENTION: EXAMPLESSION OF MICROBIAL PROPERTIES
FILE REFERENCE: 38-10 (52052)B
CURRENT APPLICATION NUMBER: US/10/369,493
CURRENT FILING DATE: 2003-02-28
FRIOR APPLICATION NUMBER: US 60/360,039
PRIOR APPLICATION NUMBER: US 60/360,039
PRIOR APPLICATION NUMBER: US 60/360,039
PRIOR FILING DATE: 2002-02-21
NUMBER OF SEQ ID NOS: 47374
SEQ ID NO 13766
LENGTH: 279
TYPE: PRT
ORGANISM: Pseudomonas fluorescens

No. is the number of results predicted by chance to h
score greater than or equal to the score of the result being
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The invention relates to a high growth methanotrophic bacterial strain, CC which grows on a Cl carbon substrate e.g. methane and methanol, and CC comprises a functional Embden-Meyerhof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutokinase enzyme or a 16s CC RNA. The bacterial strain is useful for the production of single cell CC protein and for the biotransformation of a nitrogen-containing compound, CC e.g. ammonia, nitrate, citrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a CC pigment and for reducing oxygen demand, for removing nitrates and CC mitrites in methane-containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are CC present. The bacterial strain of the invention can be used as a CC denitrifying agent for the conversion of nitrate or nitrite to nitrous oxide with methane or methanol as a carbon source. It is also used in the CC production of biomass including proteins, carbohydrates and a wide variety of pigments (particularly for isoprenoid pigments for the CC purpose of generating animal feeds), in production of terpenoid and CC carotenoid compounds, useful as pigments and as monomers in polymeric CC sequences ABG61591-ABG61590 represent high growth methanotrophic CC bacterial strain porteins of the invention

                                                                                                                                                                                                                           Š
                                                                                                                                                                                                                                                                뮹
                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for producing carotenoid compounds. CC The method comprises a transformed metabolising host cell, comprising CC suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule conding an enzyme in the carotenoid biosynthetic pathway, under the CC control of regulatory sequences, and contacting the host cell with carbon consistent to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by cusing microorganism having a nucleic acid molecule encoding enzymes in CC using microorganism having a nucleic acid molecule encoding enzymes in CC using microorganism having a nucleic acid molecule encoding enzymes in CC using microorganism having a nucleic acid molecule particle suseful in CC diet, and aquaculture elements. The carotenoids are also useful as CC intermediates in the synthesis of steroids flavours and fragrances and CC compounds for potential electro-optic applications. The present sequence CC is Methylomonas 16a sp. 4-diphosphocytidyl-2-C-methylerythritol kinase CC (IspB) enzyme used in the invention.
                                                                                                                                                                                                                                                                                                                             Query Match

The invention is useful for obtaining a nucleic acid molecule encoding an isopremoid compound biosynthetic enzyme, and for the microbial production of isopremoid compounds. The molecules of the invention are also useful for regulating isopremoid biosynthesis in an organism and for producing recompanism for producing various isopremoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isopremoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 4 (ORF4) ychB/ispE (4-diphosphocytidyl-2-C-methylerythritol kinase enzyme) protein of the invention, as described
                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The

                                                                                                                                                                                                                                                                                                                                                The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins are antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N. gonorrhoeae amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel Escherichia coli genes (I) encoding proteins (II) designated YQCP, YHBC, YGGJ, YGBP, YCHB, YGBB, YVBB and WDTB, and genes (Ia) that encode orthologous gene products (IIa) in other microorganisms and which have antibacterial activity. Recombinant microorganisms in which expression of (I) or (Ia) can be regulated are used to identify compounds that bind to the gene products, particularly in affinity selection assays. (II) and (IIa) are used to identify, or prepare, antibodies and other proteins that bind to the gene products. Substances that bind to (II) or (IIa) are potentially useful as antibacterials for treating a wide range of infections in humans and animals. Sequences antisense to (I) and (Ia) can also be used as antibacterials. The specified genes are widely distributed in bacteria but have no close homologs in eukaryotic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 23-24; 28pp; German

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an isopentenyl monophosphate kinase (IPK) polypoptide. The enzyme is an isoprenoid biosynthesis stimulator. The IPK polynucleotide is useful recombinant production of IPK, as a source of probes, primers and antisense sequences and for increasing/reducing expression levels of IPK in cells, particularly of essential oil plants, so as to increase flow through the isoprenoid biosynthesis pathway, resulting in increased production of e.g. pigments, vitamins and essential oils, also to increase resistance to pests and pathogens and to improve plant strength. Nutant forms of the IPK polynucleotide can be used to express forms of IPK that are resistant to IPK-targeted herbicides, and recombinant IPK can be used to screen for antibiotics, herbicides and antimalarial agents directed against IPK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding isopentenyl monophosphate kinase, useful e.g. for making transgenic plants with increased synthesis of isoprenoids, e.g. essential oils -

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and

Genomic sequence for Listeria monocytogenes, useful e.g. for and prevention of Listeria and related bacterial infections, related polypeptides

Claim 6; SEQ ID No 2816; 192pp; French.

The present invention relates to the genome sequence of Listeria minocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, are antibodies, identification of L. monocytogenes and related organisms, are for biosynthesis and biodegradation, especially biosynthesis of Vitamin E12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and F 0

The sequences can also be used in the diagnosts and treatment of bacterial infections, particularly S. epidermidds infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidds life cycle or inhibit S. epidermidds infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site.
                                                   useful for obtaining nucleic biosynthetic enzyme, and for altered activity -
                                                                                                          New nucleic acid molecule from Rhodococcus erythropolis AN12 strain, useful for obtaining nucleic acid encoding isoprenoid compound
                                                                                                                                                                                          N-PSDB; AAD48798.
                                                                                                                                                                                                                                                                        Bramucci MG,

            The present sequence represents an isopenteryl monophosphate kinase (II polypeptide. The enzyme is an isoprenoid biosynthesis stimulator. The IPK polynucleotide is useful recombinant production of IPK, as a source of probes, primers and antisense sequences and for increasing/reducing expression levels of IPK in cells, particularly of essential oil plants, so as to increase flow through the isoprenoid biosynthesis pathway, resulting in increased production of e.g. pigments, vitamins
                                                                                                                                                                                          New
                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel Rhodococcus erythropolis AN12 strain isoprenoid biosynthetic enzymes and polynucleotides encoding such proteins. Sequences of the invention are useful for regulating isoprenoid biosynthesis in an organism. They are useful for producing isoprenoid compounds and gene products having enhanced or altered activity. The present sequence is Rhodococcus erythropolis ygbp.

Mutant forms of the IPK polynucleotide can be used to express forms of IPK that are resistant to IPK-targeted herbicides, and recombinant IPK can be used to screen for antibiotics, herbicides and antimalarial agents directed against IPK.

```

The present sequence represents an isopentenyl monophosphate kinase (II polypeptide. The enzyme is an isopremoid biosynthesis stimulator. The IPX polynucleotide is useful recombinant production of IPX, as a source of probes, primers and antisense sequences and for increasing/reducing expression levels of IPX in cells, particularly of essential oil plants, so as to increase flow through the isopremoid biosynthesis pithway, resulting in increased production of e.g. pigments, vitamins and essential oils, also to increase resistance to pests and pathogens

source

New nucleic acid encoding isopentenyl monophosphate kinase, useful e. for making transgenic plants with increased synthesis of isoprenoids,

The present sequence represents an isopentenyl monophosphate kinase (IP) polypeptide. The enzyme is an isopentald biosynthesis stimulator. The IPX polynucleotide is useful recombinant production of IPX, as a source of probes, primers and antisense sequences and for increasing/reducing expression levels of IPX in cells, particularly of essential oil plants, so as to increase flow through the isopremoid biosynthesis pathway, resulting in increased production of e.g. pigments, vitamins and essential oils, also to increase resistance to pests and pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and to improve plant strength. Mutant forms of the IPK polynucleotide can be used to express forms of IPK that are resistant to IPK-targeted herbicides, and recombinant IPK can be used to screen for antibiotics, herbicides and antimalarial agents directed against IPK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           04-NOV-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      isoprenoids. Herbicide resistant enzymes can be used to produce herbicide formation. Methods from the present invention can be used to produce herbicide resistant enzyme variants which can be incorporated into plants to confer selective herbicide resistant on the plants. The methods are also useful for controlling weed by cultivating crops containing herbicide-resistant genes in the presence of weed-controlling effective amounts of herbicides. The inhibitors are used for inhibiting the biosynthesis of isoprenoids in plants, bacteria or protozoa. The present sequence represents the Arabidopsis thaliana yould present invention. leader sequence, which is given in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes functional enzymes (I) which operate in the alternative isoprenoid pathway downstream from 2C-methyl.D-erythritol-4-phosphate. (I) can be used as isoprenoid biosynthesis inhibitor. The enzymes are useful for screening a chemical library for inhibitors of the biosynthesis of isoprenoids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2C-methyl D-erythritol-2,4-cyclopyrophosphate or 4-diphosphocytidyl-2C-methyl-D-erythritol-2-phosphate, or their salts are useful for screening for inhibitors of the biosynthesis of sopprenoids. Herbicide resistant enzymes can be used as genetic markers

Sequence 16, Application US/09434774A Patent No. 6235514 GENERAL INFORMATION:

APPLICANT: Croteau, Rodney B
APPLICANT: Lange, Bernd M
TITLE OF INVENTION: NUCLEIC ACID MOLECULES ENCODING ISOPENTENYL
TITLE OF INVENTION: MONOPHOSPHATE KINASE, AND METHODS OF USE
FILS REFREENCE: WEUL14448
CURRENT APPLICATION NUMBER: US/09/434,774A
